STA/PUB-VITAL STAT/02-38

PREFACE

The annual report of vital statistics is produced by the Department of Statistics from registered vital events of the Registrar General's Department. This includes births, deaths, and marriages for 2010. Statistical information on divorces was compiled from the records of the Supreme Court Registry. However, divorces presented in this report are limited to the number of Decree Absolutes registered yearly.

National registration of vital events such as births and deaths became mandatory within the legal framework of this country over two centuries ago. Statistical tabulations of births and deaths in the Bahamas which date back to the 1940s were produced by the Registrar General's Department (Civil Registry). In 1968, the Department of Statistics was established by law. As a result, all statistical reporting of vital events and other data became the responsibility of the Department.

The Department of Statistics maintains a close working relationship with the Ministry of Health, as it pertains to a number of vital statistics occurrences such as the annual census of live births, infant mortalities and stillbirths. Crude rates of these events are estimated on the number of occurrences. These annual percentages and rates are key when measuring demographic trends.

The annual registration of births in the Bahamas has increased considerably in recent years. Analysis revealed that for 2010, the country recorded 5049 live births of which 4915 were registered. This means that less than three percent (2.7%) or 134 births were not registered and were not included in the annual birth analysis for this year.

ACKNOWLEDGEMENTS

Acknowledgements are due first to the Registrar General and Staff of the Registrar General's Department, especially Mr. Wellington Smith of the Data Management Section. Thanks also to the Ministry of Health, particularly Ms. Camille Deleveaux in the Health Information & Research Unit. A debt of gratitude is extended to the Staff of the Supreme Court Family Registry for their support. To users of vital statistics data, thank you for making our efforts meaningful.

Expressions of thanks and appreciation are acknowledged for the Staff of the Department of Statistics whose combined contributions made this publication possible.

DATA NOTES & EXPLANATIONS

Age Group	Single years of age are assembled for the purposes of data presentation and analysis.
Age-Specific Rate	Rate obtained for specific age group of the population.
Birth	Live births.
Country of Birth	Country where mother was born.
Birth Order	The sequence of births (also called parity) to a woman from the first to the last birth.
Crude Rate	Crude rates for live births, deaths, infant deaths and stillbirths are estimated on the number of occurrences reported for the year. Crude rates for deaths and marriages are based on the registered account.
Median Age	The age at which half the population is younger and half is older.

Note – All death tables with the exception of table 15 exclude stillbirths.

UND	Under

HIGHLIGHTS OF VITAL EVENTS: 2010

LIVE BIRTHS

- Live birth occurrences in The Bahamas contracted by 5.6% from the previous year. This trend which started in 2007 continues into the current year (2010), resulting in the lowest crude birth rate (14.4) ever recorded for the country (Table 1).
- Unwed mothers accounted for approximately 61% of births in 2010 (Table 13).
- Females between the ages of 25-29 had the highest fertility rate of about 100 births among the child bearing population (Table 6).
- Births to teen mothers inched up slightly by point seven of one percent over the previous year (Table 13).
- Women of Haitian origin contributed just over 69% of births among mothers whose births place is outside The Bahamas (Table 2).

DEATHS

- The annual mortality rate declined marginally, from 6.0 in 2009 to 5.9 in 2010 (Table 1).
- The incidences of death were highest among males at 1,108 or a rate of 6.5. The female segment recorded a total of 915 deaths or 5 per thousand female population in 2010 (Table 3).
- The leading causes of death for this year were heart diseases, which claimed about (24%); followed by cancer with 19%. External causes, such as accidents, suicide and homicide (murders) accounted for 12% of total deaths (Table 5).
- Infant mortality rate decreased by 1.3 percentage points from 21.1 in 2009 to 19.8 in 2010 (Table 1). Stillbirths had a similar trend for the same period.

MARRIAGES

- The rate of registered marriages by residents remained relatively stable around 5.5 for 2010, although it has not recaptured the annual levels recorded earlier during this decade.

APPENDIX

DEFINITIONS

The United Nations “Handbook of Vital Statistics Methods” makes the following recommendations for the definitions of the vital events analyzed in this report.

- 1) **LIVE BIRTH** is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which after separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles whether or not the umbilical cord has been cut or the placenta is attached; each product of such a birth is considered live-born.

All live-born infants should be registered and counted as such irrespective of the period of gestation or whether alive or dead at the time of registration, and if they die at any time following birth they should also be registered and counted as deaths.

In the event of a legitimate birth the names of both the mother and the father are recorded on the birth registration form. For an illegitimate birth, the name of the mother only is recorded, except where a joint application for the name of the father to be recorded, has been made by both parents.

DEATH is the permanent disappearance of all evidence of life at any time after live-birth has taken place (post-natal cessation of vital functions without capability of resuscitation). This definition therefore, excludes foetal deaths.

FOETAL DEATH is death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the foetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

STILLBIRTH refers to a “late foetal death” or the death prior to complete expulsion or extraction from its mother of a product of conception, which has attained 22 or more completed weeks of gestation, the death is indicated by the fact that after such separation, the foetus does not breathe or show any other evidence of life.

A stillbirth (or late foetal death) is registered as both a birth and a death, the sex of the stillborn child being recorded if possible. However, stillbirths are classified separately in the report and are not included with the other deaths or live-births.

- 5) **INFANT DEATH** is the number of deaths before the first birthday has been attained.

- 6) **MARRIAGE** is the legal union of persons of the opposite sex. The legality of union may be established by civil, religious, or other means as recognized by the laws of each country; and irrespective of the type of marriage, each should be reported for vital statistics purposes.

- 7) **DIVORCE** is the final legal dissolution of a marriage, that is the separation of husband and wife by a judicial decree, which confers on the parties the right to civil and /or religious remarriage, according to the law of each country.

DEFINITIONS OF FERTILITY AND REPRODUCTION RATES

CRUDE BIRTH RATE (CBR)

The CBR indicates the number of live births per 1000 population in a given year. Most annual rates relate demographic events to the population at mid-year which is considered to be the average population at risk during the year. Births are only one component of population change; therefore the birth rate should not be confused with the growth rate which includes all components of change.

General Fertility Rate (GFR)

The GFR is a more refined measure than the crude birth rate because it relates births more closely to the age-sex group at risk of giving birth (i.e., women 15-49 years of age). This eliminates distortions that might arise because of different age and sex distributions in a total population. The general fertility rate is more indicative of changes in fertility behavior than is the crude live-birth rate.

Total Fertility Rate (TFR)

This is the average number of children that would be born alive to a woman (or a group of women) during her lifetime if she was to pass through all her childbearing years conforming to the age-specific fertility rates of a given year. The TFR sums up in a single number the fertility of all women at a given point in time. In effect, it says: This is the total number of children a woman would have if she had the same chance of having a birth at age 15-19 as all women that age in a given year; at age 20-24 as all women that same year; at age 25-29, and so forth up to age 49.

Gross Reproduction Rate (GRR)

The GRR is the average number of daughters that would be born to a women (or group of women) during her lifetime if she passed through her childbearing years conforming to the age-specific fertility rates of a given year. This rate is like the TFR except that it counts only daughters and literally measures “reproduction” – a woman reproducing herself by having a daughter.

Net Reproduction Rate (NRR)

The NRR is the average number of daughters would be born to a woman (or group of women) if she passed through her lifetime from birth conforming to the age-specific fertility and mortality rates of a given year. This rate is similar to the gross reproduction rate, but is always lower than

the GRR because it takes into account the fact that some women will die before completing their childbearing years.

THE CALCULATION OF RATES (TABLE 1)

Crude Live-Birth Rate = Number of live-births which occurred among the population during a given year X 1000
Mid-year population for the same year.

General Fertility Rate = Number of live-births which occurred among the population during a given year X 1000
Number of women of child-bearing age (15-49) in the same population.

Total Fertility Rate = The sum of the age-specific fertility rates per 1,000 women of child-bearing age times five (5).

Gross Reproduction Rate = The total fertility rate in a given year times the proportion of total births that were female in a given year.

Net Reproduction Rate = The sum of the multiplications of (a) each five-year age-specific fertility rate including only female live-birth and (b) the number of person-years lived in the female stationary population (1999-2001 Life Table for The Bahamas) for the age interval corresponding to the fertility rate (c) divided by 100,000 (i.e. 100,000 new born baby girls).

Crude Death Rate = Number of deaths which occurred among the population during a given year X 1000
Mid-year population for the same year.

Infant Mortality Rate	=	Number of deaths under 1 year of age which occurred among the <u>population during a given year</u> X 1000 Number of live-births which occurred among the population during the same year.
Stillbirth (Late Foetal Death) Rate	=	Number of foetal deaths of 22 or more completed weeks of gestation which occurred among the population during a given <u>Year</u> X 1000 Number of live-births + stillbirths which occurred among the population during the same year.
Perinatal Mortality Rate	=	Number of foetal deaths of 22 or more completed weeks of gestation plus the number of infant deaths to those aged under 7 days occurring among the <u>population during a given year</u> X 1000 Number of live-births which occurred among the population during the same year.

This is a definition that can vary. There is no general agreement as to the range of infant mortality, which should be included. In the report the rates are calculated as defined above, but other perinatal rates may be calculated to include infant deaths aged less than 28 weeks.

Neo-natal Mortality Rate =
$$\frac{\text{Number of deaths under 28 days of age which occurred among the population during a given year}}{\text{Number of live-births which occurred among the population during the same year.}} \times 1000$$

Natural Increase Rate = Subtract the crude death rate from the crude birth rate. Example, in 2008 the Natural Increase Rate per thousand was $16.2 - 5.2 = 11.0$.

Crude Marriage Rate =
$$\frac{\text{Number of marriages which occurred among the population during a given year}}{\text{Mid-year population for the same year.}} \times 1000$$

Crude Divorce Rate =
$$\frac{\text{Number of divorces which occurred among the population during a given year}}{\text{Mid-year population for the same year.}} \times 1000$$
